Our production processes

Litho Transfer Print

Generally used for larger orders requiring photographic images, tones and tints. In transfer printing, the design is created by printing the colours in layers onto a special paper to build up the whole design (usually 4 colour process and/or spot colours). This is then cover coated so that the design can be “slid” off the sheet when submerged in water and hand applied to the mug.

Gilding/Colour Banding

Give your creation that finishing touch by adding a gold or platinum rim or handle flash. Using real precious metals in liquid form, our gilders will hand apply delicate lines to enhance the quality and feel of your finished item.

Direct Screen Print

For simpler designs we can offer a screen printed product whereby the colour is screened directly onto the mug by machine; the perfect cost effective option for smaller print runs or less complicated artwork.
